An uncompromised innovation delivering both camber and rocker profile benefits at the same time. The cambered inside edge supports Power Spine technology and assures edge grip and stability and the rockered outside edge allows faster and more direct turns.

Power Spine is characterized by a special construction that follows the distributions of force from the legs to the ski. The ski's interior construction, spine arch, is stronger and reinforced with a carbon layer along its entire length. The side elements/bones assure torsional stability also on the outside of the ski. The new technology has been developed in the whole race range, which also includes the FIS skis, the GSX, and the Ripstick skicross model used by Filip Flisar in the Ski Cross World Cup.

Power Spine changes the rules of the racing world. Power Spine technology, a genetic evolution of race ski construction, with its spine and bones provides better edge grip and torsional stability; the Amphibio® Profile enables faster and direct turn initiation. The new technology has been developed in the whole race range, which also includes the FIS skis, the GSX, the Ripstick skicross model and all race junior skis plus a new specific GSX Master for this faster growing category.
